Project Report 14

Human Activity Recognition from Smart Phone Data

NAME: DHIVAKAR.R

COURSE: Al and ML

Question:

Perform activity recognition on the dataset using a hidden markov model. Then perform the same task using a different classification algorithm (logistic regression/decision tree) of your choice and compare the performance of the two algorithms

Prerequisites

What things you need to install the software and how to install them:

Python 3.6 This setup requires that your machine has latest version of python. The following url https://www.python.org/downloads/ can be referred to download python. Once you have python downloaded and installed, you will need to setup PATH variables (if you want to run python program directly, detail instructions are below in how to run software section). To do that check this: https://www.pythoncentral.io/add-python-to-path-python-is-not-recognized-asan-internal-or-externalcommand/. Setting up PATH variable is optional as you can also run program without it and more instruction are given below on this topic.

Second and easier option is to download anaconda and use its anaconda prompt to run the commands. To install anaconda check this url https://www.anaconda.com/download/ You will also need to download and install below 3 packages after you install either python or anaconda from the steps above Sklearn (scikit-learn) numpy scipy if you have chosen to install python 3.6

Dataset Link: Human Activity Recognition with Smartphones

https://www.kaggle.com/uciml/human-activity-recognition-with-smartphones

Implementation

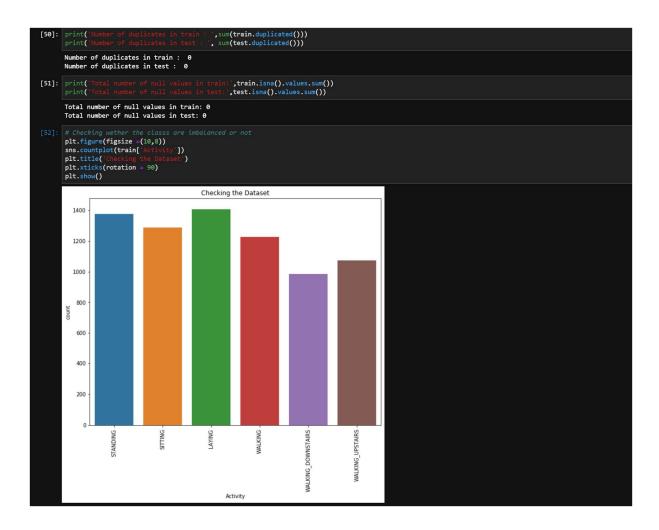

Importing the libraries and dataset

```
[47]: import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
import warnings
warnings.filterwarnings('ignore')
```

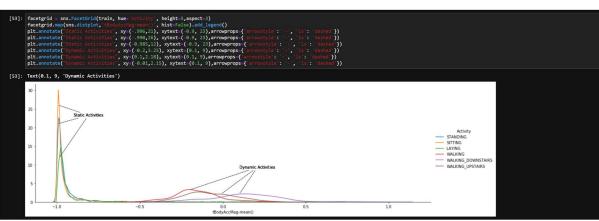

Read the data set

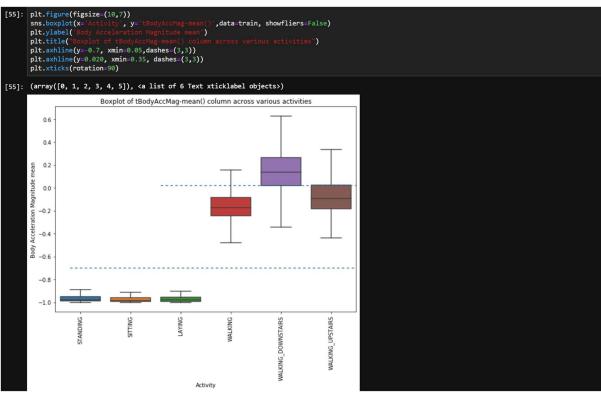

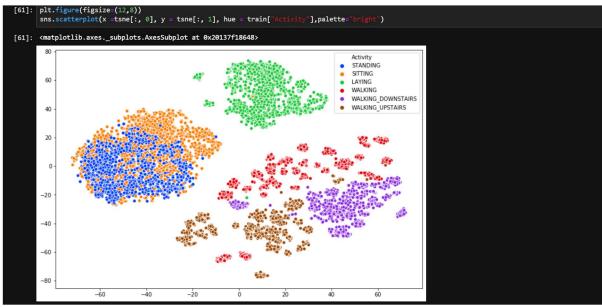

Visualization of data:

```
[54]: plt.figure(figsize=(10,8))
plt.subplot(1,2,1)
plt.title( Small Activity (Clo
sns.distplot(train[train[ Activ
sns.distplot(train[train[ Activ
sns.distplot(train[train[ Activ
plt.subplot(1,2,0,0,5,0,35])
plt.subplot(1,2,0)
plt.title( Dynamic Activities(c
sns.distplot(train[train[ Activ
sns.distplot(train[train[ Activ
sns.distplot(train[train[ Activ
sns.distplot(train[train[ Activ
                                                                                                                         )
ITTING']['tBodyAccMag-mean()'],hist = False, label = 'Sitting')
